

Lesson 22

Real world HTML project

In this lesson we will create real world HTML website completely from scratch. We will implement all that we have learned in this course, so, you will see real world implementation for all HTML tags and HTML elements that we have learned.

We will use HTML only with some barely use of CSS (Cascading Style Sheets) for changing color of font, for positioning of HTML elements in web page, and some simple hover effects that will make our website more beautiful.

Our website will represent website for this HTML course. We will have four pages, **Home**, **About**, **Course**, and **Contact** page.

Home page will look like this:

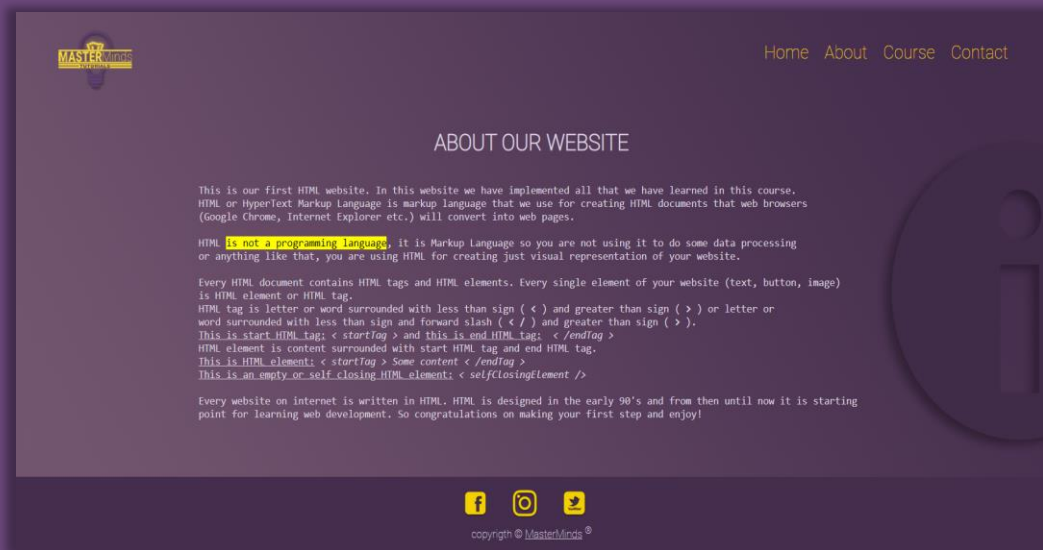

Here we have some basic information about website, and we have links to other web pages that we have. Our website users will be able to access to other web pages of website through the links that we have in navigation, and also, they can use image links that are centralized on the screen.

We will show you how to create navigation for your website, link logo that can guide you on home page, footer links for your social media pages etc.

Thank You for choosing us! ♥

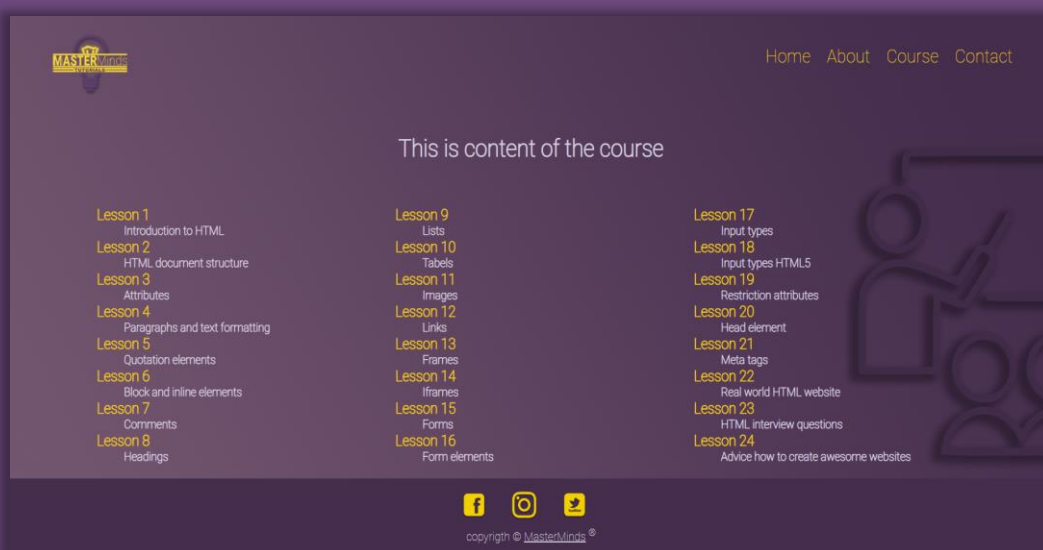

Lesson 22

About page will look like this:

In about page we have description of website. You will see how to use text formatting HTML elements.

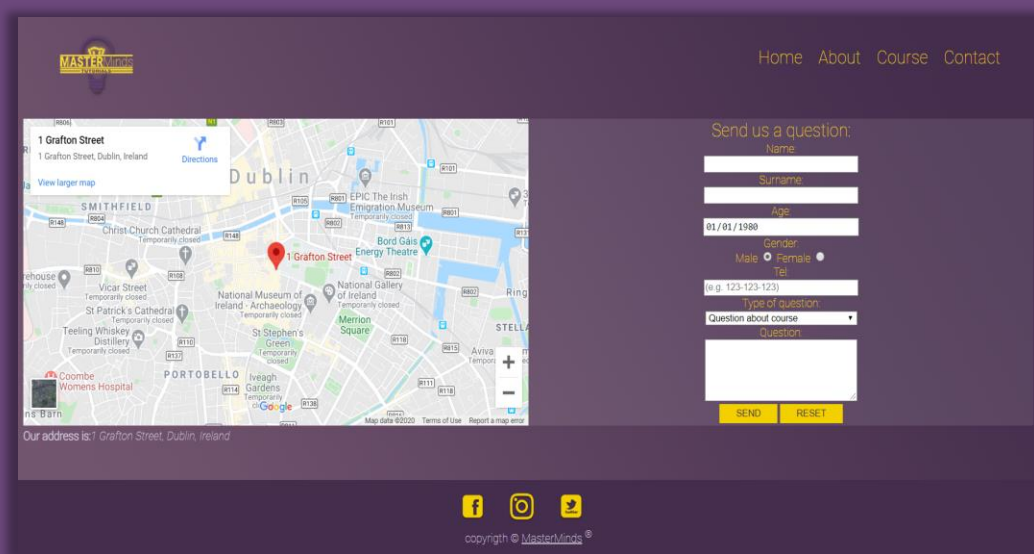

Course page will look like this:

Lesson 22

In this page we have list of all lessons that we have in course. Therefore, you will see how to use list HTML elements in your website.

Contact page will look like this:

This page has map with location of our (fictional) company, and it has question form where website users can enter question that they can send. (send functionality and data processing is not implemented here because it requires knowledge and use of some script language).

So, in this page we will see how to use iframe to import map in our website, and how to use HTML form and various form elements (input fields, radio buttons, buttons etc.)

We have prepared all additional materials (images, icons etc.) that you will need to create website that looks exactly like this website. Of course, concept of building website is same so you can use any others, your materials, to create your own website that can be just like you want.

Let's dive in our video lesson and let's create this website together!
